

Operating System I – Fall 2017

Examples of code using thread

Clément Aubert

October 17, 2017

General Presentation

This code was presented during the lecture, and is poorly commented on purpose. To compile any of those files, use

```
gcc -lpthread threadx.c
```

where `x` is the number of the program you want to compile. This will create a file named `a.out`. To execute it, use

```
./a.out
```

If you have questions, feel free to reach me at caubert@augusta.edu.

Presentation of the programs

- `thread1.c` is the code presented during the lecture, with some additional printing and comments.
- `thread2.c` illustrates how a variable could be accessed from both `main` and `inc_x`.
- `thread3.c` illustrates how the return value of the thread could be read from the main function.
- `thread4.c` illustrates how we can test if the `pthread_join` was successful.
